SwissLedger, The Institutional Blockchain Introduction

- The City of Lugano in Switzerland has emerged as a **leading hub for fintech and blockchain experimentation**.
- **2020** – Issuance of the **first city-level payment token** (LVGA) ([Beretta et al., 2025](#)).
- **2021** – Launch of **3Achain**, a **permissioned blockchain network maintained by local institutions**, as a public infrastructure project on which the LVGA is tokenized ([3Achain White Paper, 2021](#); [Ticino Blockchain Technologies Association, 2022](#)).
- **2025** - **SwissLedger** was conceived as the next **evolution of Lugano's blockchain initiative**. *SwissLedger* aims to scale the *3Achain* concept into a national infrastructure for digital finance, transforming a city experiment into a **Swiss-wide platform for banking and industry** ([SwissLedger White Paper, 2025](#)).

SwissLedger, The Institutional Blockchain

SwissLedger

Ledger

- *SwissLedger* is a **public permissioned blockchain network**: network where only authorized entities can validate transactions.
- Uses a **Proof-of-Authority (PoA)** consensus mechanism: provides fast, energy-efficient validation, and improves regulatory compliance ([De Angelis et al., 2018](#)).
- Built on the **Ethereum Virtual Machine (EVM)**, the global standard for executing smart contracts.
- **Anchored to Bitcoin and Ethereum**: provides public verifiability and network resilience ([Buterin, 2014](#); [Nakamoto, 2008](#)).
- **Consortium governance** model: **30+ nodes** managed by **public and private institutions** ensuring decentralization and shared control ([Wood, 2016](#); [Buterin, 2014](#); [De Filippi and Wright, 2018](#))
- All nodes are identical, but some have the additional capability to **validate blocks**.
- **Simple nodes** act as relayers, resubmitting transactions.
- **Validator nodes** combine the relayer role with the ability to include transactions in blocks.
- Adding a validator node requires approval from **the majority** of existing validators.
- Adding any node requires approval from the **SwissLedger consortium** (City of Lugano).

Multiple Layers Structure of *SwissLedger*

1. **Core Ledger Layer:** Records transactions and asset registrations and ensures the immutability and transparency of records.
2. **Smart Contract Layer:** This enables automation of complex processes within the network itself, removing the need for intermediaries or duplicative processes.
3. **API & Integration Layer:** Provides standard APIs and interfaces for banks and fintech applications, ensuring secure connectivity and interoperability.
4. **Compliance Layer:** Includes tools and mechanisms to ensure adherence to compliance requirements, such as Anti-Money Laundering (AML). AI detection system for fraudulent behaviour.
5. **Security Layer:** Combines cryptographic and cybersecurity protections to secure resilience suitable for critical infrastructure.
6. **Asset Tokenization Module:** Supports tokenized assets (e.g. bonds, currencies, real estate, ...) on the ledger, enabling programmable finance & next-gen digital instruments, improving market efficiency.

POA
Proof of Authority

POW
Proof of Work

POS
Proof of Stake

- **PoW (Proof-of-Work):** Secures the network through computational effort (mining).
- **PoS (Proof-of-Stake):** Secures the network by validators locking up their own coins (staking) as collateral.
- **PoA (Proof-of-Authority):** Secures the network using a set of pre-approved, reputable validators (authorities) based on their identity.

Infrastructure & Security

- **Validator Induction Ceremony** - Network security is maintained through a consensus ceremony. A new validator node can only join the active registry when a majority (\$n\$) of existing nodes formally sign to accept the entrant, ensuring a trusted network topology.
- **Whitelist-Based Access Control** - Swiss Ledger employs a hierarchical permissioning system. Root Administrators empower Sub-Administrators to onboard specific wallet addresses, ensuring that every participant on the chain is a known, authorized entity ultimately subject to compliance oversight.
- **Mempool Rate Limiter** - To guarantee network stability, the mempool enforces a strict limit of 8 sequential transactions per wallet. Any excess is automatically dropped. This effectively mitigates spam and DDoS attacks—a critical safeguard given the zero-fee structure—by preventing single entities from saturating the network.

Financial Mechanics

- **Atomic Cash-Back Settlement** - Efficiency is maximized through a single-transaction execution model. Unlike legacy systems, the LVGA token handles payment settlement and cash-back issuance within the same block (atomic transaction), streamlining reconciliation and user rewards.
- **LVGA Double-Sign Transaction** - Token transactions may require a dual-approval process (like LVGA): the user initiates the request, and the token's smart contract countersigns it. This architecture allows the protocol to enforce dynamic rules—such as monthly spending caps or frequency limits—before execution.
- **ERC-2980 Adv Standard** - We introduced a proprietary extension to the standard ERC-20 model (ERC-2980 Adv). This format is specifically engineered to encapsulate Swiss financial assets, embedding regulatory requirements and asset-specific attributes directly on-chain.

Developing Technologies

- **EVM Financial Compliance Layer (In Development)** - We are building a dedicated execution layer where financial regulations are native to the environment. This EVM-compatible layer automatically enforces AML, KYB, and KYC rules at the protocol level, streamlining compliance for institutions.
- **Digital Identity & Storage (In Development)** - This initiative integrates the official Swiss e-ID for on-chain authentication, paired with a custom decentralized storage solution. This ensures that sensitive identity data remains secure, sovereign, and fully compatible with Swiss digital standards.

HOW IT WORKS

1. Wecan App

Each App has distributed data storage and communicate directly with an API to tokenize data and generate hashes enables to be "Blockchain-agnostic".

2. Wecan Chain

A Transaction ID is generated by Wecan Chain and returned to the app, which publish a hash to Swiss Ledger.

3. Layer 2: Swiss Ledger

Swiss Ledger is a POA private blockchain. Wecan operates a simple and sign nodes here.

→ [Learn more about Swiss Ledger](#)

4. Base layer: Ethereum

Ethereum is a POS public blockchain. We issue our ERC 20 token on Ethereum and Swiss Ledger anchors a daily root hash on it.

Authenticity: *Verify Lugano*

Challenges in PA Document Certification

Inefficiency

- **Slow and disconnected processes:** many records exist only in paper form, with fragmented information collection or stored in separated formats (data silos).

Transparency

- Risks of data loss, information manipulation, and corruption are persistent threats to such systems, **undermining public trust in government institutions** and processes ([Dong et al., 2021](#); [Balatska et al., 2024](#))

Security

- Centralized models create a **single point of failure**, making systems highly vulnerable to **cyberattacks, unauthorized access, data manipulation, and data loss**.
- Example: In 2015, hackers accessed sensitive government data of 20 million individuals in US.
- **Lack of transparency and traceability** in public documentation increases risks of **corruption**, and creates challenges in complying with **GDPR/LPD requirements** ([Balatska et al., 2024](#))

Automation and Scalability

- Traditional registries **lack of automation and scalability** characteristics

Blockchains as a Solution...

- **Transparency** through decentralized architectures
- Increase **traceability**: Reduces opportunities for manipulation and unauthorized access to information
- High level of **security**, which is a place to protect data from cyber-attacks

Potential limits of the adoption (Balatska et al., 2024)

- High initial costs
- Need of technical structure

Potential limits of the adoption

(et al., 2024)

- High

Need of technical structure

...*SwissLedger* is the Solution

- **Solve potential limits:** Network and technical infrastructure already existing in the Swiss framework.
- **Permissioned blockchain (Proof-of-Authority)** providing secure, auditable, and energy-efficient certification.
- **Immutable and transparent records** for notarization, tokenization, and time-stamping of documents.
- Embedded **compliance features (KYC/AML)** supporting regulated financial and administrative use cases.

Live Applications

Public Administration Documents Authenticity

A production-ready service for notarizing digital public administration's documents, providing immutable proof of existence and data integrity. This solution has been successfully adopted by the Statistical Office of the City of Lugano. It has been applied to official statistical report and Open Government Data (OGD).

SwissLedger, The Institutional Blockchain

Applications in the Banking and Finance Sector

SwissLedger, The Institutional Blockchain
Application in the Banking and Finance Sector

- Modern economies depend on **digital infrastructure**, mostly **privately owned**.
- This creates **market failures**:
 - **Underinvestment** in robustness, interoperability, inclusivity ([Ostrom, 1990](#); [Hess and Ostrom, 2007](#))
 - **Monopolistic control** over essential digital services
- Digital platforms often exhibit **public good characteristics**.
- The concept of **treating digital infrastructures as "digital commons"** gained traction.
- One domain where these issues arise is **financial services**.

FINANCIAL AND MONETARY SYSTEMS

What's next for Open Banking?

Apr 6, 2021

INTERNATIONAL Banker

AUTHORITATIVE ANALYSIS ON INTERNATIONAL BANKING

WHY 2025 IS SET TO BE A PIVOTAL YEAR FOR OPEN BANKING

May 13, 2025

SwissLedger, The Institutional Blockchain Application in the Banking and Finance Sector

- **Legacy banking infrastructure is siloed:**
 - No standardized data exchange
 - Limited innovation
- **Open Banking as a global response** ([Colangelo and Khandelwal, 2025](#); [Zetsche, 2020](#)):
 - Promotes secure API-based data sharing
 - Empowers third-party fintechs
 - Gives control to consumers
- **Early evidence** – UK as a pioneer ([Open Banking Limited, 2023](#)):
 - 11% of British consumers use open banking
 - Monthly open-banking payments **doubled**
 - Result: improved **innovation, efficiency** and reduced **banking costs**
- Open banking frameworks are now being **implemented or studied in over 50 countries.**

- In this context, **Switzerland (CH)** **approach** to open banking has been **divergent** ([Open Banking Project Switzerland, 2022](#)).
- Being not part of the EU, CH is **not bound by the** EU's Payment Services Directive (**PSD2**) which mandated open banking in 2018.
- CH opted for a **market-led, voluntary approach** ([Rabe, 2023](#)).
- In parallel, Swiss financial authorities have crafted an innovation-friendly regulatory **framework for blockchain and distributed ledger technology (DLT)**.
- CH was among the **first countries to enact a comprehensive DLT legal framework** (from 2021) to provide legal certainty for tokenized assets and DLT-based infrastructure ([Federal Council of Switzerland, 2018](#)).

SwissLedger, The Institutional Blockchain
Application in the Banking and Finance Sector

SwissLedger addresses two key issues:

1. The problem of **privately-owned** digital infrastructure by shifting toward **consortium governance** and **open access**.
 2. The need to foster **open banking** and innovation through a **ready-to-use, API-driven ledger**.
- *SwissLedger* proposes to treat **open banking** services as common infrastructure; analogous to making the financial IT infrastructure a **shared "railroad" on which many can ride**, rather than each institution building its closed system.
 - *SwissLedger* aims to create a common, standardized **open finance platform**, much like the **unified ledger model of the Finternet** framework proposed by [Carstens and Nilekani \(2023\)](#).

Who Benefits from *SwissLedger*? Shared Value Across Stakeholders

1. Consumers:

- Faster and cheaper financial services
- Secure and immutable transaction records
- Potential digital identity portability for KYC processes

2. Banks:

- Lower IT costs by sharing infrastructure, reducing the need for individual blockchain investments

3. Fintech Companies:

- Simplified market entry through open APIs and standardized smart contract support

4. Regulators & Public Sector:

- Built-in tools for audit, compliance, and AML monitoring
- Support for public fund distribution and digital identity services
- Enhanced Switzerland's digital sovereignty by keeping critical fintech infrastructure under national control

We propose a high-level roadmap for *SwissLedger*'s growth from pilot to **large-scale infrastructure**:

1. **Pilot and Proof-of-Concept:** *SwissLedger* evolved from Lugano's *3Achain*, completing its test phase with validated transactions, governance setup, and legal compliance. **COMPLETED**
2. **Early Adoption in Niche Use Cases:** *SwissLedger* is transitioning to real-world applications. The aim is to launch at least five live use cases, expand to over 50 network nodes, and achieve initial user adoption. **ONGOING**
3. **Expansion to Core Financial Sector:** Large banks are onboard, Regulatory approvals and central bank participation enhance credibility. *SwissLedger* could become Switzerland's open finance standard, aligning with the SBA's framework. **ONGOING**
4. **Nationwide Adoption and Optimization:** *SwissLedger* integrates fully into Swiss finance, optimizing performance, security, and accessibility. Government endorsement may make it a regulatory standard for financial registries. **NEXT STEP**
5. **International Connectivity and Innovation:** *SwissLedger* expands globally by connecting with initiatives like the European Blockchain Services and export Switzerland's fintech model through innovations. **NEXT STEP**

SwissLeder, The Institutional Blockchain

Swiss Digital Key

1. Tokenization of Digital Assets

- Digitization of real-world assets to improve liquidity and accessibility (RWA)
- Simplification of asset management and transfer
- Access to new investment and financing instruments

2. Custodial Crypto Services for Banks and Professionals

- Secure custody compliant with regulations for banks and asset managers
- Decentralized and multi-signature custody to reduce fraud risk
- Integration between crypto-assets and traditional finance
- Representatives of decentralized assets

3. Trade Finance

- Reduction of intermediaries and transaction costs
- Tokenization of traditional financial instruments (including the use of stablecoins)
- Automation of supply chain financing
- Creation of smart payment systems to reduce settlement times
- Near-instant settlement (T+0)

4. Decentralized data, identity & documents

- Decentralized data management
- Decentralized KYC & AML on blockchain (digital validation compliant with regulations)
- Interoperability with EU and Swiss regulations
- Data privacy, security, and protection
- Certification and notarization of documents

5. Legal Framework, Compliance, Regulation and Lobbying Activities

- Assessment of existing regulatory sandboxes or the need for new ones
- Dialogue with regulatory institutions and banking associations
- Collaboration with legal experts to ensure compliance

The [Swiss Blockchain Federation](#) is thrilled to welcome the [Città di Lugano](#) as its newest member - and the first municipality to join our federation! 🇨🇭

Lugano is rapidly establishing itself as one of Europe's leading hubs for blockchain innovation, building an ecosystem where digital technologies fuel economic growth and smart city development. Through progressive policies and strategic initiatives, the city has successfully integrated its institutional blockchain, SwissLedger, into public services, commerce, and education - creating a dynamic environment for startups, investors, researchers, banks, and global innovators.

Together, we are committed to strengthening Switzerland's position as a global blockchain leader and ensuring that regulatory frameworks continue to foster innovation and sustainable growth in this transformative industry. 🇨🇭

Federal Council moves forward with stablecoins and crypto: consultation launched

Bern, 22.10.2025 — During its meeting on 22 October 2025, the Federal Council initiated the consultation on an amendment to the Financial Institutions Act. The bill is aimed at improving the framework conditions for the market development, the attractiveness of the Swiss financial centre and integration of innovative financial technologies into the existing financial system. At the same time, it should mitigate related risks to financial stability, integrity, and investor and consumer protection. The consultation will run until 6 February 2026.
